

Peru: Regional Profiles

National Disaster Preparedness Baseline Assessment

Martín's high multi-hazard risk is a function of its very high multi-hazard exposure (MHE = 0.754), low vulnerability (V = 0.404), and moderate coping capacity (CC = 0.464). The ternary graph at right shows that San Martín's exposure is significantly higher than the national average, while vulnerability and lack of coping capacity are close to the national averages for these components.

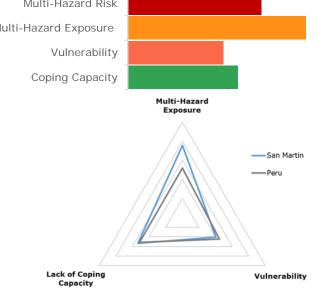

Figure 1. Components of the Multi-Hazard Risk Score compared to the national average.

¹ Multi-Hazard Risk (MHR): An index that measures the likelihood of losses or disruptions to a region's normal function due to interaction between multi-hazard exposure, socioeconomic vulnerability and coping capacity. MHR = (MHE + V + (1-CC))/3. Values range from 0-1.

Components of Multi-Hazard Risk (MHR)²

Multi-Hazard Exposure (MHE)		Vul	nerability (V)	Coping Capacity (CC)		
Ve	ery High		Low	ľ∿	loderate	
Score	Rank (of 25)	Score	Rank (of 25)	Score	Rank (of 25)	
0.754	4	0.404	16	0.464	14	

Table 1. Scores and ranks for each component of the Multi-Hazard Risk Score.

Multi-Hazard Exposure (MHE)³

Score = 0.754, Rank = 4 of 25

San Martín has very high multi-hazard exposure relative to other regions of Peru (MHE = 0.754). This score is a function of both Raw and Relative MHE, as shown in Figure 2. The Raw MHE Score is an index reflecting the absolute value of population exposed to multiple hazards. This score can aid in understanding the overall scale of hazard exposure. The Relative MHE Score is an index reflecting the proportion of the region's base population exposed. This score can assist in the determination of how important hazards are, and can help prioritize disaster management activities across regions. Estimates of exposure by hazard type are summarized in Table 2.

Table 2. Estimated ambient population⁴ exposed to each hazard type.

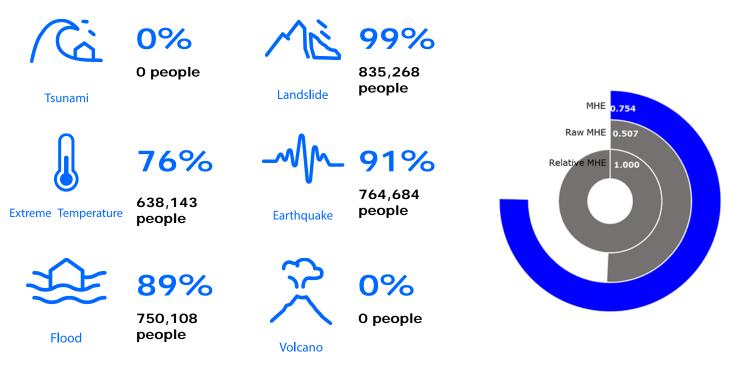

Figure 2. Average, raw and relative Multi-Hazard Exposure Scores.

 $^{^{2}}$ MHR = (MHE + V + (1-CC))/3.

³ **Multi Hazard Exposure (MHE)**: An index based on the estimated average exposure of the population to six hazard types: tsunamis, landslides, extreme temperature, earthquakes (MMI VII and above), floods and volcanos. Average exposure considers both raw average exposure and relative average exposure as a proportion of total population. Values range from 0-1.

⁴ Ambient Population: 24-hour average estimate of the population; typically differs from census population.

Vulnerability (V) ⁵

Score = 0.404, Rank = 16 of 25

San Martín has low vulnerability relative to other Peruvian regions (V = 0.404). The bar chart on the right displays the composition of its overall Vulnerability Score. As shown, vulnerability in San Martín is driven primarily by clean water access, gender inequality, and information access. The table below summarizes the individual indicators within each socio-economic theme.

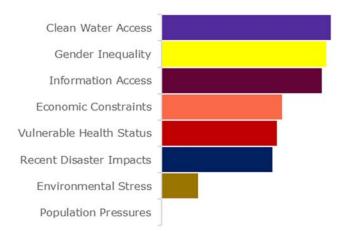

Figure 3. Components of the Vulnerability Score by relative contribution.

Table 3. Indicators of vulnerability grouped by theme.

	Environmental Stress	1.0 % of total regional area with irrigation- fed agriculture	0.1 % of total regional area with severe erosion				
	Vulnerable Health Status	19.2 Infant mortality rate per 1k births	73.1 Maternal deaths per 100k births	71.3 Average life expectancy (years) at birth	15.5 % of children under 5 years of age that are malnourished	3.8 % of population with 1 or more disability	
0	Clean Water Vulnerability	78.1 % households with access to improved water	40.3 % households with access to flush toilets				
	Information Access Vulnerability	8.1 % of population 15yrs and older that are illiterate	8.3 Average years of schooling	77.5 % primary school enrollment	9.2 % households with internet	72.9 % households with television	70.9 % households with radio
	Economic Constraints	0.53 Ratio of dependents to working age population (15- 64 years)	55.43 Ratio of average monthly household expenses to income	30.0 % of population monetarily impoverished			
ça	Gender Inequality	0.46 Proportion of female representatives in local government	0.73 Ratio of female to male secondary enrollment	0.69 Ratio of female to male labor participation			

⁵ Vulnerability (V): An index that measures the socioeconomic conditions associated with susceptibility to disruptions in a region's normal functions. Values range from 0-1.

Population Pressures	-0.4 % Average annual population change (2010- 2015)	
Recent Disaster Impacts	332.3 Average annual hazard-related deaths per 10k persons (2010- 2014)	3.1 Average annual number of homes destroyed by recent hazards per 10k persons (2010- 2014)

Coping Capacity (CC)⁶

Score = 0.464, Rank = 14 of 25

San Martín has a moderate coping capacity relative to other regions (CC = 0.464). The bar chart on the right displays the composition of its overall Coping Capacity Score. As shown, coping capacity in San Martín is hindered primarily by its economic infrastructure (especially and healthcare) capacities. The table below summarizes the individual indicators within each theme.

Table 4. Indicators of coping capacity grouped by theme.

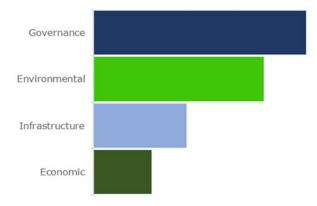

Figure 4. Components of the Coping Capacity Score by relative contribution.

\$\$	Economic Capacity	\$967 Average monthly income (\$)	\$7,752 Gross domestic product per capita			
	Governance	2.06 Registered cases of sexual violence per 10k persons	0.04 Registered cases of missing persons per 10k persons	0.003 Average annual number of social conflicts per 10k persons (active and resolved)	6,576 # of voters per 10k persons (2014 election)	
	Environmental Capacity	18.5% protected or reforested land				

⁶ Coping Capacity (CC): An index that measures the systems, means and abilities of a region to absorb and respond to events that could potentially disrupt normal function. Values range from 0-1.

Capacity

Healthcare Capacity	12.6 # of hospital beds per 10k persons	8.6 # of nurses per 10k persons	5.2 # of physicians per 10k persons
Communications Capacity	8.2 % households with fixed phone line	81.3 % households with mobile phone	
Transportation Capacity	1.0 Port/airport density per 10,000 sq km	1,001.3 Road/rail density per 10,000 sq km	

Resilience (R)⁷

Score = 0.530, Rank = 12 of 25

Resilience is a function of both vulnerability and coping capacity. San Martín's resilience is near the national average, and its moderate Resilience Score (R = 0.530) is due to its low vulnerability and moderate coping capacity. The region's baseline indicators suggest a focus for resilience-building efforts. In San Martin, the thematic areas with the weakest relative scores are summarized in the table below. Readers can additionally consult Appendix 1 for a comprehensive assessment of its need for specific program types relative to other regions.

Table 5. The top 3 thematic areas with the weakest relative scores.

⁷ **Resilience (R):** An index that offers a hazard-independent measure of current socio-economic conditions affecting the short-term ability to absorb, respond to, and recover from disruptions to a region's normal function. Values range from 0-1.
